

growwithjo Member Dashboard

Ideas & approaches for a dashboard the Homies will actually use

Prepared for becs · September 17, 2026

Date: 2026-09-17 · **For:** becs (runs growwithjo community) · **From:** Fizz **Status:** Brainstorm only – nothing gets built until becs picks a direction.

What growwithjo is (research)

- Women-focused home-workout membership, ~13,000+ members ("Homies")
- Platform: Uscreen (app id `tv.uscreen.growwithjo` – iOS/Android/TV apps + web)
- Content: 800+ on-demand workouts (walking, HIIT, tabata, pilates, strength), 20–30 min, beginner/postpartum-friendly
- Extras: "Done With Diets" nutrition course, custom meal maps, live group calls with Jo, streak tracking + progress logs
- Pricing: ~\$198.99/yr annual, monthly option; membership managed from account dashboard

Sources: growwithjo.com, [membership page](#), [Google Play listing](#), [App Store listing](#)

First: which "dashboard"?

Three different products hide inside the word – becs should pick one to start:

A. Member home screen – each Homie opens it and sees *her own* week: streak, workouts done, today's suggested workout, next live call, current milestone. Value = personal momentum. This is what most members would call "valuable."

B. Community pulse board – collective stats: total workouts this week, challenge leaderboard, shout-outs, milestones wall ("Sarah hit 100 workouts!"). Value = accountability + belonging, which is growwithjo's whole brand.

C. Ops dashboard for becs/Jo – engagement, retention, at-risk members (streak just broke, no login 14 days), challenge participation. Not member-facing, but often the highest-leverage first build because it tells you what members actually do.

Three approaches (any of the above)

1. Squeeze Uscreen first (lowest lift)

Uscreen already tracks watch history, streaks, and progress, and has an API + webhooks + Zapier. Before building anything: audit what Uscreen's member area and analytics already show, and what's just turned off or unstyled. Maybe 60% of the dream dashboard is a settings/config exercise. **Good when:** becs wants value in days, not months. **Limit:** stuck with Uscreen's layout.

2. Manual-first pilot (validate before building)

A weekly "Homie Scoreboard" – becs (with agent help) exports Uscreen data weekly, and we generate a styled page/email: community totals, streak stars, challenge standings. Zero software to maintain; proves what members actually open and care about. **Good when:** unsure what members want. **Limit:** weekly, not live; manual step.

3. Companion web dashboard (custom build)

Small web app (e.g., Next.js + Supabase) fed by Uscreen API/webhooks. Members log in and see A + B above; becs gets C as an admin view. Fully on-brand, can add things Uscreen never will (habit calendar, non-scale-victory journal, buddy pairing, monthly challenge engine). **Good when:** a validated concept deserves a real home. **Limit:** biggest lift; needs API access check first.

Fizz's recommendation

Sequence them: **1 → 2 → 3**. Audit Uscreen this week, run the manual scoreboard as a 3–4 week pilot during a challenge, then build the companion app around whatever members demonstrably love. Metric of success: % of members who check the dashboard weekly and workout-completion lift during the pilot.

Open questions for becs

1. **The big one:** when a Homie opens the dashboard, what should she *feel* – "I'm on a roll" (personal), "we're in this together" (community), or should it tell becs/Jo who needs a nudge (ops)?
2. What are becs's existing ideas? (Yatu said she has some – they should anchor this.)
3. Does she have Uscreen admin access, and does her plan include API access?
4. Is there a recurring challenge (e.g., monthly walking challenge) a pilot could ride on?
